

Denture/Partials Process

_____ (Initial) **First Visit (IMPRESSIONS)**: We will start the denture/partial process by making a highly accurate cast or mold of both the upper and the lower gums. We will determine the appropriate tooth and gum shade. This step is so the laboratory has perfect impressions of the gums/teeth on which to base the fabrication of the new dentures/partials.

Tooth Shade _____ Gum Shade _____

_____ (Initial) **Second Visit (WAX BITE)**: During this step, we review the crucial relationship between the upper and lower jaw. We will establish a proper bite and orientation (occlusion) of the teeth. In order for the denture to be an ideal fit, we will have to make sure that there is a correct alignment between the upper and lower teeth.

_____ (Initial) **Third Visit (WAX TOOTH TRY-IN)**: We will discuss important elements like the size, shape, and shade of the new teeth with the patient. Also this visit is when we decide the length of the new teeth based on the patient's mouth. The difference between this try-in and your final denture/partial is only that the teeth are not embedded in the plastic yet. Using the actual device, we are able to make adjustments and inform the lab of any changes needed before they fabricate the final product. During this step, it is your responsibility to advise the doctor or assistant of any changes you'd like to make (color, fit, shape, etc). Once this process is finalized **CHANGES CANNOT BE MADE**, If you would like to change any aspect of your denture/partial after the tooth try-in appointment after processing, the changes you make will be your financial responsibility.

_____ (Initial) **Final Visit (DELIVERY/EXT)**: At this appointment we will extract/remove any necessary teeth, as well as make any necessary minor adjustments to the dentures plastic, and you will be leaving with a brand new set of dentures/partials.
